27        List<Product> sortedProducts = sortProductsByTFIDF(tfidfScores);
28
29        System.out.println("\nproducts related to query " + userInput + " :");
30        for (int i = 0; i < Math.min(25, sortedProducts.size()); i++) {
31            System.out.println(sortedProducts.get(i).getName() + " - TFIDF Score: " + tfidfScores.get(sortedProducts.get(i)));
32        }
33    }
34 }

```

ابتدا نام فایل های محصولات و کوئری را در متغیر رشته ای ذخیره میکنیم ، سپس انها را بعنوان ارگومان های ورودی تابع پیش پردازنده ی آنها پاس میدهم . این تابع (که در ادامه مفصل تر توضیح میدهم) لیستی از محصولات / کوئری های پیش پردازش شده را بر میگرداند که آنها را در لیست های **products** و **queries** ذخیره میکنیم .

تابع دیگری تحت عنوان **calculateIDF** داریم که محصولات و کوئری را گرفته و مقدار **idf** انرا محاسبه میکند. خروجی این تابع را در **idfMap** ذخیره میکنیم.

از کاربر کوئری مدنظرش را میگیریم و در **userInput** ذخیره میکنیم. و روی آن هم پیش پردازش را انجام میدهم و نتیجه را در **proccessedQueryText**

حال مقدار tfidf را از طریق تابع calculateTFIDF محاسبه و در tfidfScore ذخیره میکنیم . و در ادامه ، با استفاده از تابع sortProducts ، محصولات با مقدار tfidf بیشتر را به شکل نزولی (از بیشتر به کمتر) مرتب میکنیم و در لیست sortedProducts قرار میدهیم .

تابع preprocessProducts :

www.PageBorders.net

این تابع وظیفه خواندن فایل محصولات و پیش پردازش توضیحات محصولات را بر عهده دارد. در ادامه به صورت خط به خط توضیح می دهیم که این تابع چه کاری انجام می دهد:

یک لیست خالی از نوع **Product** به نام **products** ایجاد می کند تا محصولات پردازش شده را در آن ذخیره کند. با استفاده از **BufferedReader** و **FileReader** فایل با نام **fileName** را باز کرده و خط به خط آن را می خواند.

درون حلقه **while**، هر خط را از فایل می خواند تا زمانی که تمامی خطوط خوانده شوند. از **StringTokenizer** برای تقسیم خط به فیلدهای جداگانه با استفاده از کاما به عنوان جداکننده استفاده می کند.

یک آرایه از رشته ها به نام **tokens** به اندازه تعداد توکن های موجود در خط ایجاد می کند. یک حلقه **while** دیگر برای ذخیره هر توکن در آرایه **tokens** اجرا می کند. توکن ها یکی یکی استخراج شده و در آرایه ذخیره می شوند و در ادامه بررسی می کند که اگر تعداد توکن ها حداقل 2 باشد:

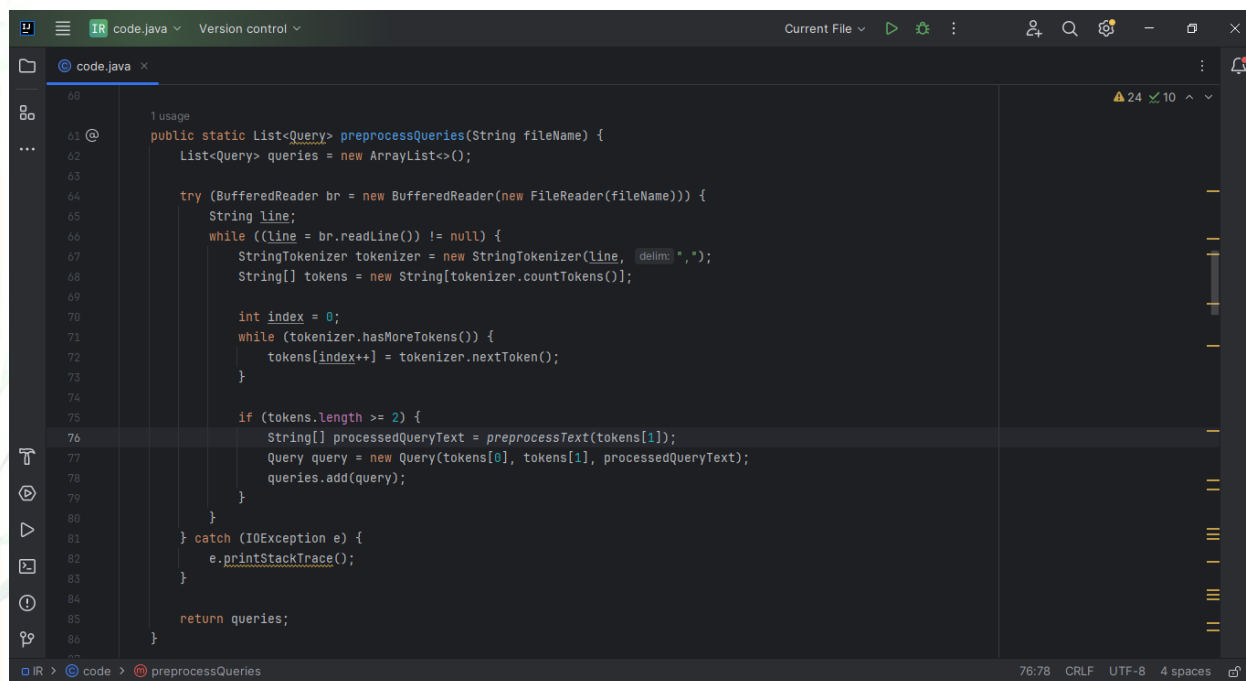

. متن توضیحات محصول (توکن دوم) را با فراخوانی تابع **preprocessText** پیش پردازش می کند.

. یک شیء **Product** جدید با شناسه محصول (توکن اول)، نام محصول (توکن دوم)، و توضیحات پیش پردازش شده ایجاد می کند.
. محصول ایجاد شده را به لیست **products** اضافه می کند.

اگر خطایی در خواندن فایل رخ دهد، آن را چاپ می کند. و در نهایت لیست **products** که شامل تمامی محصولات پیش پردازش شده است را برمی گرداند.

تابع preprocessProducts :

این تابع نیز مشابه تابع پیش پردازش محصولات ، عملیات پیش پردازش روی کوئری را انجام میدهد.

```
60  
61 @ 1 usage  
62 public static List<Query> preprocessQueries(String fileName) {  
63     List<Query> queries = new ArrayList<>();  
64  
65     try (BufferedReader br = new BufferedReader(new FileReader(fileName))) {  
66         String line;  
67         while ((line = br.readLine()) != null) {  
68             StringTokenizer tokenizer = new StringTokenizer(line, ",");  
69             String[] tokens = new String[tokenizer.countTokens()];  
70  
71             int index = 0;  
72             while (tokenizer.hasMoreTokens()) {  
73                 tokens[index++] = tokenizer.nextToken();  
74             }  
75  
76             if (tokens.length >= 2) {  
77                 String[] processedQueryText = preprocessText(tokens[1]);  
78                 Query query = new Query(tokens[0], tokens[1], processedQueryText);  
79                 queries.add(query);  
80             }  
81         } catch (IOException e) {  
82             e.printStackTrace();  
83         }  
84  
85         return queries;  
86     }  
87 }
```

تابع preprocessText :

```
87  
88 @ 3 usages  
89 public static String[] preprocessText(String text) {  
90  
91     StringTokenizer tokenizer = new StringTokenizer(text, " ");  
92     List<String> tokens = new ArrayList<>();  
93     while (tokenizer.hasMoreTokens()) {  
94         tokens.add(tokenizer.nextToken());  
95     }  
96     return tokens.toArray(new String[0]);  
97 }
```

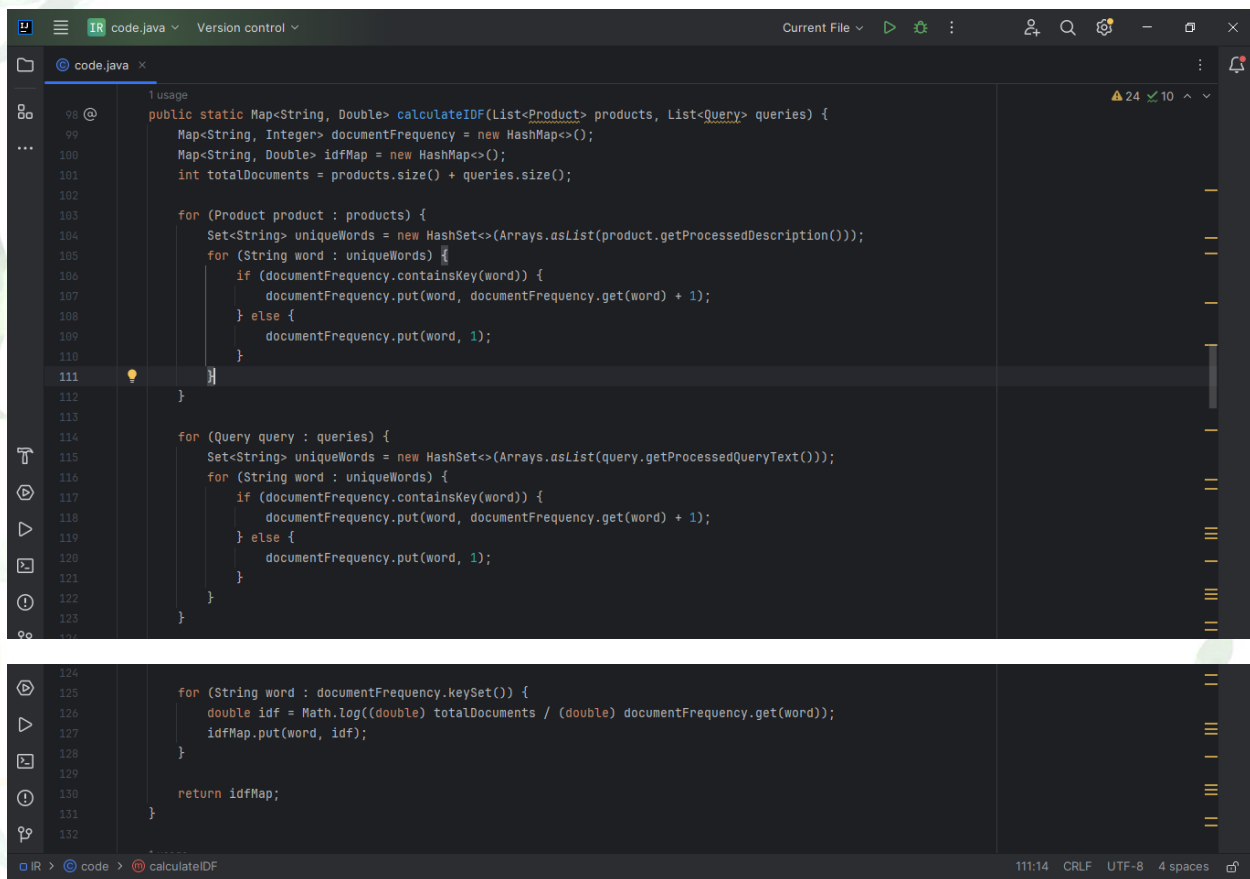

تابع preprocessText وظیفه پیش پردازش متن ورودی را دارد و آن را به آرایه ای از کلمات تبدیل می کند. یک شیء StringTokenizer ایجاد می شود که متن ورودی را با استفاده از فاصله (space) به عنوان جداکننده به توکن های جداگانه تقسیم می کند.

• یک لیست از رشته‌ها به نام **tokens** ایجاد می‌شود تا توکن‌ها در آن ذخیره شوند. در ادامه ، یک حلقه **while** برای استخراج توکن‌ها اجرا می‌شود. تا زمانی که توکن‌های بیشتری وجود دارد:

◦ توکن بعدی استخراج شده و به لیست **tokens** اضافه می‌شود.

لیست **tokens** به یک آرایه از رشته‌ها تبدیل می‌شود و برگردانده می‌شود **new String[0]** به عنوان آرگومان به متد **toArray** داده می‌شود تا نوع آرایه خروجی مشخص شود. بطور کلی ، این تابع متن ورودی را به کلمات جداگانه تقسیم کرده و آن‌ها را به صورت آرایه‌ای از رشته‌ها برمی‌گرداند.

تابع **calculateIDF**:

```
1 public static Map<String, Double> calculateIDF(List<Product> products, List<Query> queries) {
2     Map<String, Integer> documentFrequency = new HashMap<>();
3     Map<String, Double> idfMap = new HashMap<>();
4     int totalDocuments = products.size() + queries.size();
5
6     for (Product product : products) {
7         Set<String> uniqueWords = new HashSet<>(Arrays.asList(product.getProcessedDescription()));
8         for (String word : uniqueWords) {
9             if (documentFrequency.containsKey(word)) {
10                 documentFrequency.put(word, documentFrequency.get(word) + 1);
11             } else {
12                 documentFrequency.put(word, 1);
13             }
14         }
15     }
16
17     for (Query query : queries) {
18         Set<String> uniqueWords = new HashSet<>(Arrays.asList(query.getProcessedQueryText()));
19         for (String word : uniqueWords) {
20             if (documentFrequency.containsKey(word)) {
21                 documentFrequency.put(word, documentFrequency.get(word) + 1);
22             } else {
23                 documentFrequency.put(word, 1);
24             }
25         }
26     }
27
28     for (String word : documentFrequency.keySet()) {
29         double idf = Math.log((double) totalDocuments / (double) documentFrequency.get(word));
30         idfMap.put(word, idf);
31     }
32
33     return idfMap;
34 }
```

تابع `calculateIDF` وظیفه محاسبه مقدار `IDF` (Inverse Document Frequency) را برای کلمات موجود در محصولات و کوئری‌ها بر عهده دارد. `IDF` معیاری است که نشان می‌دهد یک کلمه چقدر در اسناد مختلف نادر است. هر چه کلمه در اسناد کمتری ظاهر شود، مقدار `IDF` آن بیشتر است. یک نقشه به نام `documentFrequency` برای نگهداری تعداد دفعات حضور هر کلمه در اسناد (محصولات و کوئری‌ها) ایجاد می‌کند.

یک مپ به نام `idfMap` برای نگهداری مقادیر `IDF` ایجاد می‌کند. تعداد کل اسناد (محصولات و کوئری‌ها) را در متغیری به نام `totalDocuments` ذخیره می‌کند و یک حلقه برای هر محصول اجرا می‌کند.

کلمات یکتای موجود در توضیحات محصول را به مجموعه‌ای (`Set`) تبدیل می‌کند تا از تکراری بودن کلمات جلوگیری شود.

برای هر کلمه در مجموعه:

- اگر کلمه در نقشه `documentFrequency` موجود باشد، مقدار آن یک واحد افزایش می‌یابد. در غیر این صورت، کلمه با مقدار ۱ به نقشه اضافه می‌شود.

- یک حلقه مشابه برای هر کوئری اجرا می‌کند. مانند قسمت قبل، تعداد حضور کلمات را در مپ `documentFrequency` به‌روزرسانی می‌کند.

در ادامه یک حلقه برای هر کلمه در نقشه `documentFrequency` اجرا می‌کند. مقدار `IDF` را برای هر کلمه با استفاده از فرمول $\log(\text{totalDocuments} / \text{documentFrequency})$ محاسبه کرده و آن را در مپ `idfMap` ذخیره می‌کند.

در نهایت، نقشه `idfMap` که شامل کلمات و مقادیر `IDF` آن‌ها است را برمی‌گرداند.

تابع calculateTFIDF:

```
132
133 @
134 public static Map<Product, Double> calculateTFIDF(Query query, List<Product> products, Map<String, Double> idfMap) {
135     Map<Product, Double> tfidfScores = new HashMap<>();
136     Set<String> queryWords = new HashSet<>(Arrays.asList(query.getProcessedQueryText()));
137
138     for (Product product : products) {
139         double tfidfScore = 0.0;
140         for (String word : product.getProcessedDescription()) {
141             if (queryWords.contains(word)) {
142                 double tf = (double) Collections.frequency(Arrays.asList(product.getProcessedDescription()), word);
143                 double idf = idfMap.getOrDefault(word, 0.0);
144                 tfidfScore += tf * idf;
145             }
146         }
147         tfidfScores.put(product, tfidfScore);
148     }
149
150     return tfidfScores;
151 }
```

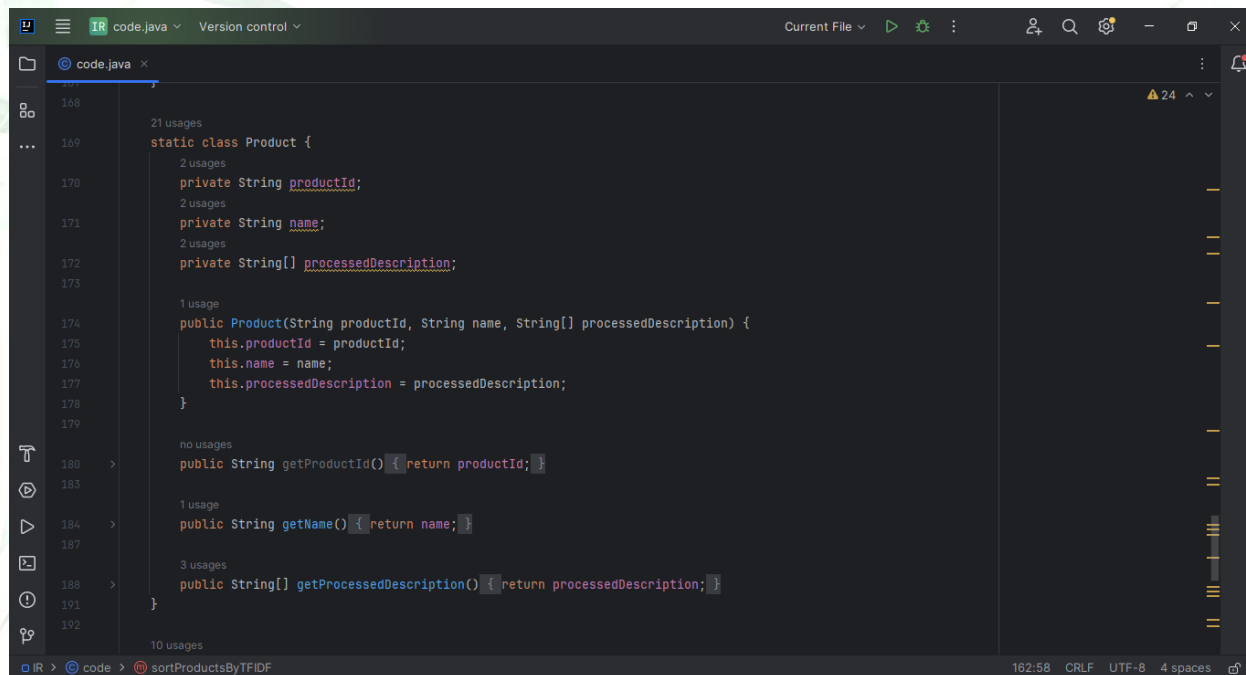

این تابع برای هر محصول در لیست، امتیاز TF-IDF را بر اساس کوئری ورودی محاسبه می‌کند و نتایج را در یک مپ ذخیره می‌کند. هر چه امتیاز TF-IDF یک محصول بالاتر باشد، نشان‌دهنده ارتباط بیشتر آن محصول با کوئری مورد نظر است.

تابع sortProductsByTFIDF:

```
145
146     tfidfScores.put(product, tfidfScore);
147 }
148
149 return tfidfScores;
150
151
152 @
153 public static List<Product> sortProductsByTFIDF(Map<Product, Double> tfidfScores) {
154     List<Map.Entry<Product, Double>> sortedList = new ArrayList<>(tfidfScores.entrySet());
155
156     Collections.sort(sortedList, new Comparator<Map.Entry<Product, Double>>() {
157         @Override
158         public int compare(Map.Entry<Product, Double> o1, Map.Entry<Product, Double> o2) {
159             return o2.getValue().compareTo(o1.getValue());
160         }
161     });
162
163     List<Product> sortedProducts = new ArrayList<>();
164     for (Map.Entry<Product, Double> entry : sortedList) {
165         sortedProducts.add(entry.getKey());
166     }
167
168     return sortedProducts;
169 }
```

این تابع محصولات را بر اساس امتیازات TF-IDF آن‌ها مرتب می‌کند و لیستی از محصولات مرتب‌شده را برمی‌گرداند، به طوری که محصولاتی که بیشترین ارتباط را با کوئری دارند در بالای لیست قرار می‌گیرند.

کلاس product:

```
code.java  Version control  Current File  24  162:58 CRLF UTF-8 4 spaces
static class Product {
    private String productId;
    private String name;
    private String[] processedDescription;

    public Product(String productId, String name, String[] processedDescription) {
        this.productId = productId;
        this.name = name;
        this.processedDescription = processedDescription;
    }

    public String getProductId() { return productId; }

    public String getName() { return name; }

    public String[] getProcessedDescription() { return processedDescription; }
}
```

فیلدها و توابع مرتبط با کلاس محصولات مثل گترها را پیاده میکنیم .

کلاس query:

```
code.java  Version control  Current File  24  162:58 CRLF UTF-8 4 spaces
static class Query {
    private String queryId;
    private String queryText;
    private String[] processedQueryText;

    public Query(String queryId, String queryText, String[] processedQueryText) {
        this.queryId = queryId;
        this.queryText = queryText;
        this.processedQueryText = processedQueryText;
    }

    public String getQueryId() { return queryId; }

    public String getQueryText() { return queryText; }

    public String[] getProcessedQueryText() { return processedQueryText; }
}
```

برنامه را ران میکنیم و کوئری مورد نظر را وارد میکنیم :

متن خروجی :
